Usage in teaching/learning

In pixel graphics, patterns and shapes are made up of many small dots on a square grid (using a very large sheet and many dots, you can draw photo-like images with this method, but the image will be distorted and pixelated when enlarged).

Vector graphics uses a mathematical trick to build the image much more simply, using lines and dots. These can be enlarged, rearranged, shaped and coloured the way you prefer, they are not pixelated or distorted.

- graphics and illustrations
- business cards, letter paper, brochures, flyers, posters

"A picture is worth a thousand words."

In our increasingly visual world we often prefer to look at a well-designed, informative poster with some text than read a long leaflet on the same subject. This is particularly true for our students, so it makes sense to present them the information in a form they can easily digest. An excellent tool for this is an infographic, which presents the information using images.

You can also use it to check understanding: ask students to present in an infographic what they have learned. It is also useful for organizing learning content from different parts of the curriculum. Units of measurement or historical events are a good example for this.
